

Email process using existing VB process to send through O365

This process will send emails using a VB6 backend process, sending out as email coming from LMSDataProcessing@TrustLineage.com

Example assumes email base name = **BaseName**

Foldername and all text files will share the same name/nameprefix. In the examples below, that is **BaseName**

If no attachments are needed, skip step 1

- 1) If attachments are needed, create folder named **BaseName** in \\dpm2\email\

Copy attachment(s) files to \\DPM2\email**BaseName**\

Create text file named \\DPM2\Email**BaseName**attach.txt

write 1 line per file with the path and file name

- 2) Create \\DPM2\Email**BaseName**body.txt

Type message for email body

- 3) Create \\DPM2\Email**BaseName**subject.txt

Type message for email subject line

- 4) Create \\DPM2\Email**BaseName**.txt

Type individual email addresses on their own lines

Once **BaseName**.txt file has been written to folder, email will fire off
